## The Future of Analog IC Technology

## DESCRIPTION

The MP2117 is an internally compensated 2.2A synchronous step-down switcher. The operating frequency is internally set at 1.25 MHz . MP2117 is ideal for powering portable equipment that runs from a single cell Lithium-Ion (Li+) Battery. The MP2117 can provide up to 2.2A continuous load current from a 2.5 V to 6 V input voltage. The output voltage can be regulated as low as 0.6 V . $100 \%$ duty cycle provides low dropout operation that extends operating time in batteryoperated systems.
The MP2117 features an integrated high-side switch and synchronous rectifier for high efficiency. With peak current mode control and internal compensation, the MP2117 can be stabilized with ceramic capacitors and small inductors. Fault condition protection includes cycle-by-cycle current limiting and thermal shutdown.
MP2117 is available in the small 10-pin $3 m m x 3 m m$ QFN and SOIC-8 packages.

## FEATURES

- 2.2A Output Current
- 2.5 V to 6 V Input Range $\mathrm{V}_{\mathrm{IN}}$
- Internal Power MOSFET Switches
- Low Dropout Operation: 100\% Duty Cycle
- Up to $90 \%$ Efficiency
- Stable with Ceramic Output Capacitors
- $1 \mu \mathrm{~A}$ Shutdown Current
- 1.25 MHz Switching Frequency
- Thermal Shutdown
- Cycle-by-Cycle Over Current Protection
- Output Short Circuit Protection
- Internal Soft-start
- Power On Reset Output
- Available in $10-\mathrm{Pin}$ QFN ( $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ ) and 8-pin SOIC Packages

## APPLICATIONS

- DVD+/-RW Drives
- LCDTV
- PDAs
- Portable Instruments
"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## TYPICAL APPLICATION

Efficiency vs. Load Current

ORDERING INFORMATION

SOIC8E .................................. 50 ...... 10 ... ${ }^{\circ} \mathrm{C} / \mathrm{W}$

## Notes:

1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature $T_{J}(M A X)$, the junction-toambient thermal resistance $\theta_{\mathrm{JA}}$, and the ambient temperature $T_{A}$. The maximum allowable continuous power dissipation at any ambient temperature is calculated by $P_{D}(M A X)=\left(T_{J}\right.$ $\left.(\mathrm{MAX})-\mathrm{T}_{\mathrm{A}}\right) / \theta_{\mathrm{JA}}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
3) The device is not guaranteed to function outside of its operating conditions.
4) Measured on JESD5 1-7, 4-layer PCB.

## ELECTRICAL CHARACTERISTICS ${ }^{(5)}$

$\mathrm{V}_{\mathrm{IN}}=\mathrm{V}_{\mathrm{EN}}=3.6 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+\mathbf{2 5}{ }^{\circ} \mathrm{C}$, unless otherwise noted.

| Parameters | Condition | Min | Typ | Max | Units |

OPERATION

## Figure 1-Functional Block Diagram

The MP2117 is a 1.25 MHz fixed frequency current mode synchronous step-down switcher. The MP2117 is optimized for low voltage, Li-lon battery powered applications where high efficiency and small size are critical. The MP2117 can provide up to 2.2A continuous load current from a 2.5 V to 6 V input voltage.
The MP2117 uses an external resistor divider to set the switcher output voltage from 0.6 V to 6 V .

### 2.2A Step-Down Switcher

The switcher integrates both a main switch and a synchronous rectifier, which provides high efficiency and eliminates an external Schottky diode.

The duty cycle D of a step-down switcher is defined as:

$$
\mathrm{D}=\mathrm{T}_{\mathrm{ON}} \times \mathrm{f}_{\mathrm{OSC}} \times 100 \% \approx \frac{\mathrm{~V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}} \times 100 \%
$$

Where $T_{\text {ON }}$ is the main switch on time and $f_{\text {Osc }}$ is the oscillator frequency ( 1.25 MHz ).

## Current Mode PWM Control

Slope compensated current mode PWM control provides stable switching and cycle-by-cycle current limiting for superior load and line response in addition to protection of the internal main switch and synchronous rectifier. The MP2117 switches at a constant frequency $(1.25 \mathrm{MHz})$ and regulates the output voltage. During each cycle the PWM comparator
modulates the power transferred to the load by changing the inductor peak current based on the feedback error voltage. During normal operation, the main switch is turned on for a certain time to ramp the inductor current at each rising edge of the internal oscillator, and switched off when the peak inductor current is above the error voltage. When the main switch is off, the synchronous rectifier will be turned on immediately and stay on until the next cycle starts.

## Dropout Operation

The MP2117 allows the main switch to remain on for more than one switching cycle and increases the duty cycle while the input voltage is dropping close to the output voltage. When the duty cycle reaches $100 \%$, the main switch is held on continuously to deliver current to the output up to the PFET current limit. The output voltage then becomes the input voltage minus the voltage drop across the main switch and the inductor.

## Short Circuit Protection

When the output is shorted to ground, the oscillator frequency is reduced to prevent the inductor current from increasing beyond the PFET current limit. The PFET current limit is also reduced to lower the short circuit current. The frequency and current limit will return to the normal values once the short circuit condition is removed and the feedback voltage reaches 0.6 V .

## Maximum Load Current

The MP2117 can operate down to 2.5 V input voltage; however the maximum load current decreases at lower input due to a large IR drop on the main switch and synchronous rectifier. The slope compensation signal reduces the peak inductor current as a function of the duty cycle to prevent sub-harmonic oscillations at duty cycles greater than $50 \%$. Conversely, the current limit increases as the duty cycle decreases.

## Power OK

The MP2117 provides an open-drain PWROK output that goes high after the output reaches regulation during startup. PWROK goes low after the output goes out of regulation by $\pm 10 \%$ or when device enters shutdown. There is $50 \mu \mathrm{sec}$ deglitch timer built in to avoid PWROK false triggered during load transient.

## Enable Control

MP2117 has a dedicated Enable control pin. By pulling it to high or low, the IC can be enabled and disabled by EN. Tie EN to VIN by proper voltage divider for automatic start up as Figure 2 shows. And make sure that:

Max. EN Threshold $<V_{I N} \times \frac{R_{E N 2}}{\left(R_{E N 1}+R_{E N 2}\right)}<6 \mathrm{~V}$

Figure 2

## APPLICATION INFORMATION

## Output Voltage Setting

The external resistor divider sets the output voltage. It is optional to speed loop response by adding a small feedforward capacitor $\mathrm{C}_{\mathrm{F}}$ parallel with R1. Choose R1* $\mathrm{C}_{\mathrm{F}}$ time constant around 3usec.
Choose R2 value between $1 \mathrm{k} \Omega$ and $100 \mathrm{k} \Omega$. R 1 is then given by:

$$
\mathrm{R} 1=\mathrm{R} 2 \times\left(\frac{\mathrm{V}_{\mathrm{OUT}}}{0.6 \mathrm{~V}}-1\right)
$$

Table 1—Resistor Selection vs. Output Voltage Setting

| $\mathbf{V}_{\text {OUT }}$ | R1 | R2 |
| :---: | :---: | :---: |
| 1.2 V | $60.4 \mathrm{k} \Omega$ | $60.4 \mathrm{k} \Omega$ |
| 1.5 V | $90.9 \mathrm{k} \Omega$ | $60.4 \mathrm{k} \Omega$ |
| 1.8 V | $121 \mathrm{k} \Omega$ | $60.4 \mathrm{k} \Omega$ |
| 2.5 V | $191 \mathrm{k} \Omega$ | $60.4 \mathrm{k} \Omega)$ |
| 3.3 V | $274 \mathrm{~K} \Omega$ | $60.4 \mathrm{k} \Omega$ |

## Inductor Selection

A $1 \mu \mathrm{H}$ to $10 \mu \mathrm{H}$ inductor with DC current rating at least $25 \%$ higher than the maximum load current is recommended for most applications. For best efficiency, the inductor DC resistance should be $<100 \mathrm{~m} \Omega$. See Table 2 for recommended inductors and manufacturers. For most designs, the inductance value can be derived from the following equation:

$$
\mathrm{L}=\frac{\mathrm{V}_{\text {OUT }} \times\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {OUT }}\right)}{\mathrm{V}_{\text {IN }} \times \Delta \mathrm{I}_{\mathrm{L}} \times \mathrm{f}_{\text {OSC }}}
$$

Where $\Delta L_{L}$ is inductor ripple current. Choose inductor ripple current approximately $30 \%$ of the maximum load current, 2.2A.
The maximum inductor peak current is:

$$
L_{L(M A X)}=I_{\text {LOAD(MAX) }}+\frac{\Delta I_{L}}{2}
$$

Table 2-Suggested Surface Mount Inductors

| Manufacturer | Part Number | Inductance $(\boldsymbol{\mu H})$ | Max DCR (m) | Saturation Current (A) |
| :---: | :---: | :---: | :---: | :---: |
| Wurth | 7447745012 | 1.2 | 17 | 4.6 |
| Toko | D62LCB-\#A918CY-1R0M | 1.0 | 17 | 3.7 |

## Switcher Input Capacitor $\mathrm{C}_{\mathrm{IN}_{1}}$ Selection

The input capacitor reduces the surge current drawn from the input and switching noise from the device. The input capacitor impedance at the switching frequency should be less than input source impedance to prevent high frequency switching current passing to the input. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. For most applications, a $10 \mu \mathrm{~F} \sim 22 \mu \mathrm{~F}$ capacitor is sufficient.

Switcher Output Capacitor Cout1 Selection
The output capacitor keeps output voltage ripple small and ensures regulation loop stable. The output capacitor impedance should be low at the switching frequency. Ceramic capacitors with X5R or X7R dielectrics are recommended. For most applications, a $22 \mu \mathrm{~F} \sim 47 \mu \mathrm{~F}$ capacitor is sufficient.

The output ripple $\Delta \mathrm{V}_{\text {OUT }}$ is approximately:
$\Delta V_{\text {OUT }} \leq \frac{V_{\text {OUT }} \times\left(V_{\text {IN }}-V_{\text {OUT }}\right)}{V_{\text {IN }} \times f_{\text {OSC }} \times L} \times\left(E S R \frac{1}{8 \times f_{\text {OSC }} \times C_{\text {OUT }}}\right)$

## Thermal Dissipation

Power dissipation should be considered when MP2117 provide maximum 2.2A output current to the loads at high ambient temperature. If the junction temperature rises above $150^{\circ} \mathrm{C}$, the MP2117 will be shut down.

The junction-to-ambient thermal resistance of the 10-pin QFN or 8-pin SOIC $R_{\text {बJA }}$ is $50^{\circ} \mathrm{C} / \mathrm{W}$. The maximum power dissipation is about 1.6 W when the MP2117 is operating in a $70^{\circ} \mathrm{C}$ ambient temperature environment.

$$
\mathrm{PD}_{\operatorname{MAX}}=\frac{150^{\circ} \mathrm{C}-70^{\circ} \mathrm{C}}{50^{\circ} \mathrm{C} / \mathrm{W}}=1.6 \mathrm{~W}
$$

Top Layer

## PCB Layout

The high current paths (GND, IN, OUT and SW) should be placed very close to the device with short, direct and wide traces. Input capacitors should be placed as close as possible to the respective IN and PGND pins. The external feedback resistors should be placed next to the FB pins. Keep the switching nodes SW short and away from the feedback network. An external diode (i.e. B130) can be added between SW and GND to reduce switching noise and to improve the load regulation. The reference layout and its schematic are shown below:
